*March 2025*

**NEVADA HEALTH  
WORKFORCE**  
RESEARCH CENTER

*Nursing Workforce in Nevada – 2025* is a publication from the Nevada Health Workforce Research Center in the Office of Statewide Initiatives at the University of Nevada, Reno School of Medicine.

The mission of the Office of Statewide Initiatives is to improve the health of Nevadans through statewide engagement, education, and research.

The purpose of the Nevada Health Workforce Research Center is to improve the collection and analysis of data on health workforce supply and demand to enhance health workforce planning and development in Nevada.

# Nursing Workforce in Nevada – 2025

*Nursing Workforce in Nevada – 2025* contains the most currently available data on the nursing workforce in Nevada. Drawing on data from the Nevada State Board of Nursing, U.S. Bureau of Labor Statistics, and unpublished data collected by the Nevada Health Workforce Research Center, this report provides a snapshot of statewide and regional nurse workforce trends in Nevada. The report includes information on licensure, employment, and earnings for the following four nursing occupations: registered nurses (RNs), advance practice registered nurses (APRNs), licensed practical nurses (LPNs), and certified nursing assistants (CNAs).

## Key Findings

Key findings on nursing licensure and certification trends over the past decade contained in *Nursing Workforce in Nevada – 2025* include:

- The number of registered nurses in Nevada increased from 21,563 in 2014 to 33,875 in 2024 – an increase of 12,312 or 57.1% (Table 1).
- During the same time period, the number of RNs per 100,000 population in Nevada increased from 762.3 to 1,029.8 – an increase of 35.1% (Table 2).
- Figures 1 and 2 highlight the growth of the RN workforce across regions of the state – the greatest growth has taken place in Clark County where the number of RNs licensed by the State of Nevada has grown by 9,931 or 64.8% over the past decade.
- Over the past decade, the number of advanced practice registered nurses in Nevada increased from 901 in 2014 to 3,507 in 2024 – an increase of 2,606 or 289.2% (Table 3).
- During the same time period, the number of APRNs per 100,000 population in Nevada increased from 31.7 to 106.6 – an increase of 236.4% (Table 4).
- Figures 3 and 4 illustrate the growth of the APRN workforce across every region of the state over the past decade.
- The number of licensed practical nurses in Nevada increased from 2,977 in 2014 to 3,638 in 2024 – a modest increase of 661 or 22.2% (Table 5).

- However, during the same time period, the number of licensed practical nurses per 100,000 population in Nevada increased from 105.2 to 110.6 – an increase of only 5.1% (Table 6).
- Figures 5 and 6 highlight trends in the LPN workforce across regions of Nevada over the past decade. Over the past decade, both the numerical and per capita growth in the LPN workforce across the state has been relatively flat for the past six years.
- The number of certified nursing assistants in Nevada increased from 7,223 in 2014 to 9,475 in 2024 – an increase of 2,252 or 31.2% (Table 7).
- During the same time period, the number of CNAs per 100,000 population in Nevada increased from 262.7 to 288.0 – an increase of 9.6% (Table 8).
- Figures 7 and 8 illustrate regional trends in the CNA workforce since 2014 – these data reveal modest numerical growth in the CNA workforce across the state and negative per capita growth in northern Nevada.

Key findings on nursing workforce employment and earnings in this report include:

- Tables 9 through 12 provide the most current data from the U.S. Bureau of Labor Statistics on the employed nursing workforce in Nevada by region of the state. These tables also provide estimates of the number of additional nurses needed to meet national per capita rates of employed nursing personnel.

In order to meet national per capita employment rates, Nevada would need an additional 4,913 registered nurses, an additional 717 advanced practice registered nurses, an additional 3,154 licensed practical nurses, and an additional 5,372 CNAs.

- Tables 13 and 14 summarize the most current data on the average hourly and annual wage of the employed nursing workforce in Nevada by region of the state.

The average annual salary of an employed RN in Nevada is \$97,700 and ranges from \$94,250 in rural counties to \$98,190 in Clark County.

The average annual salary of an employed APRN in Nevada is \$148,670 and ranges from \$138,730 in rural counties to \$154,720 in Carson City.

- Figure 9 summarizes registered nurse employment and earnings in Nevada and neighboring states. This figure highlights that each of the six states bordering Nevada possess shortfalls in the number of RNs that are needed to reach national per capita averages, ranging from 2,041 RNs needed in Oregon to 41,103 RNs needed in California. All seven Western states are experiencing nursing workforce shortages aggravated by above-average population growth and aging populations.

This report provides current information on registered nurse graduation and retention trends from nursing programs in the Nevada System of Higher Education (NSHE) and private nursing programs in Nevada. Highlights from *Nursing Workforce in Nevada – 2025* include:

- From 2014 to 2023, the number of registered nurse program graduates in Nevada increased by 980 or 122.0% (Table 15).
- Figures 10 and 11 highlight graduation trends from, respectively, bachelor-degree and associate-degree programs in Nevada over the past decade. Despite pandemic-related disruptions from 2020 to 2023, both NSHE and private nursing programs across the state have experienced steady growth in the number of graduates prepared for licensure in Nevada over the past decade.
- Figures 12 and 13 provide unpublished data collected by the Nevada Health Workforce Research Center on nursing program graduates from, respectively, NSHE bachelor of science in nursing (BSN) and associate degree in nursing programs who plan to remain in Nevada upon graduation to begin their nursing careers. These data indicate consistently high levels of nursing graduate retention across the state over the course of the decade.
- Over the past decade, retention rates from NSHE BSN programs ranged from 73.2% to 98.3% (Figure 12) and retention rates from NSHE associate's degree in nursing programs have ranged from 73.3% to 97.4% (Figure 13).

Note: A location quotient (LQ) for an occupation in Nevada is a measure of the occupation's concentration within the state or a region of the state compared to the national average. An LQ greater than 1.0 indicates a higher concentration of an occupation than the national average. An LQ below 1.0 represents a lower concentration of an occupation in the state or a region of the state than the national average. Registered nurses and most health care occupations in Nevada have LQs below the national average (1.0).

**Table 10: Advanced Practice Registered Nurse Employment in Nevada – 2023**

## **Discussion and Policy Considerations**

Data contained in *Nursing Workforce in Nevada – 2025* highlight the considerable progress made over the past decade in increasing the number of registered nurses and advanced practice registered nurses licensed by the Nevada State Board of Nursing and practicing in the state. The report also documents progress made by public and private education programs that prepare students for licensure as registered nurses in Nevada. Even more encouraging, growth in the number of registered nurses licensed and employed in patient care settings in Nevada have begun to outpace population growth for the first time in decades.

Nonetheless, the report's analysis of employment data indicates that employment rates for all nursing occupations are well below national averages. Indeed, the report's conclusions on the number of additional nursing personnel needed to meet national per capita rates are sobering. To meet national employment rates or averages, Nevada would need an additional:

- 4,913 registered nurses
- 717 advanced practice registered nurses
- 3,154 licensed practical nurses
- 5,372 certified nursing assistants

In short, like many other segments of the health workforce in Nevada, the nursing workforce remains underdeveloped by regional and national standards.

Nevada policymakers and nursing stakeholders must continue to pursue strategies that expand the nursing workforce supply in order to meet the evolving health care needs of Nevada residents and the growing demand for registered nurses in our state across a wide range of health care settings. The nursing shortage threatens access to health care in Nevada when available hospital beds and service lines are reduced or, worse, closed due to inadequate staffing.

The nursing shortage also results in added costs borne by Nevada citizens and health care employers, including productivity losses due to instability in the existing workforce, added labor costs associated with traveling nurses and extended overtime for existing nursing staff, additional recruitment costs, training and onboarding costs for new hires, and patient safety failures and medical errors when facilities are understaffed.

In the simplest terms, the nursing shortage refers to a demand for registered nurses by employers in Nevada in excess of the available supply registered nurses. Population growth and aging, continued insurance coverage expansion, and a recovering economy will drive steady demand for health care services and, thus, the need for additional registered nurses in Nevada over the next decade.

As noted, Nevada has recently made steady progress in expanding the supply of licensed health professionals across the state, including the nursing workforce, over the past decade. However, hospitals and other employers of nurses in Nevada continue to report high vacancy rates and turnover for registered nurses, as well as ongoing reliance on expensive travel nurses to meet hospital and long-term care staffing needs. Nevada’s nursing workforce shortage is compounded by an aging nursing workforce beginning to exit the workforce and continued labor market volatility in the wake of the pandemic.

Analysis by the Nevada Health Workforce Research Center reveals persistent, widespread health professional shortages in Nevada. Currently, there are approximately 2.2 million Nevadans or 64.9% of the state’s population reside in a federally-designated primary medical care health professional shortage area (HPSA) – 12 of 17 counties in Nevada are single-county primary medical care HPSAs. Worse, an estimated 3.0 million Nevadans or 91.3% of the state’s population reside in a federally designated mental health professional shortage area – 15 of 17 counties in Nevada are single-county mental HPSAs. Efforts to address the nursing shortage thus have added urgency given competing health workforce development challenges and enduring unmet population health needs in Nevada. As such, addressing the current nursing shortage is critical to improving population health and reducing health disparities in Nevada.

Nursing workforce shortages will require the pursuit of policy measures and strategies to increase the supply of registered nurses, improve the diversity of the nursing workforce, and address the geographic maldistribution of the state’s nursing and health workforce. Above all, increasing the supply of nurses will require expanded and targeted investments in public nursing degree programs to increase the number of graduates at all degree levels across all regions of Nevada.

The Nevada State Legislature plays a critical role in ensuring that Nevada’s health, education, and workforce policies address access barriers, control health care costs, and meet the health care needs of its residents. In the broadest terms, state policy measures and actions to address nursing and other health workforce shortages fall into three general categories or “buckets”:

- 1) *“Grow your own” strategies and policy measures that expand existing Nevada System of Higher Education (NSHE) nursing and health care education programs and capacity in Nevada.* These measures also include education-industry collaboration such as nurse apprenticeship programs and the ongoing development of nursing career ladders within larger hospitals and health systems.
- 2) *Strategies and policy measures that “stretch” the existing nursing and health workforce in Nevada.* These measures include the utilization and reimbursement of telehealth

technologies and team-based models of care that maximize the use of nurses and other health support staff practicing at the top of their scope of practice and licensure.

- 3) *“Recruitment and retention” strategies and policy measures that tap the available nursing workforce in other states and countries.* These strategies include the participation in inter-state licensure compacts and reciprocity agreements. These measures also include state and federal programs that provide loan repayment funds to nurses and other eligible practitioners in exchange for their service in rural and medically underserved communities in the state.

Addressing current and projected nursing workforce shortages will require state policymakers to prioritize and implement proven policy measures and strategies from all three buckets. Some measures will require new or expanded general fund support from the state legislature for NSHE nursing programs, while other measures will require policy changes to existing state law, or administrative and licensing regulations for nursing education and health facilities.

All successful strategies and policy measures will require greater collaboration and coordination among state policymakers, the health care industry, higher education, and an increasingly diverse set of nursing workforce stakeholders in Nevada during the current legislative biennium and beyond. Eliminating the current nursing shortage is an essential component of our state’s strategy to improve access to care, contain health care costs and spending, and improve population health in the coming decade.
